

**Full-scale Fire Tests on
Hollowcore Floor System**

Colin Bailey: *University of Manchester*

Why ?

Evidence from small-scale tests of possible premature shear failure

Evidence from real fires suggests that hollowcore floors have a inherent FR

Pragmatic approach: Provided units are tied (together with a peripheral tie) then shear failure should not occur

But !

Class 2A buildings

Class 2A Buildings

Offices, hotels, and residential buildings not exceeding 4 storeys

Industrial buildings not exceeding 3 storeys

Class 2B Buildings

Offices, hotels, and residential buildings greater than 4 storeys but less than 15 storeys.

Hospitals not exceeding 3 storeys

Class 3 Buildings

Buildings not defined as Class 2A or 2B

Thermal expansion of units is restrained provided the columns are tied and the tie beams do not expand more than the units.

Test Structure: 7.02m×17.76m (internal plan dimensions) ×3.6m height

15 units 1.2m wide×200mm deep

Different end restraints (Test 1 & Test 2)

Test 1

Test 2

No additional 'fixity'

Class 2A

(Generally under 4 stories)

T12 u-bars per unit were placed around 19mm dia stud.

Class 2B

Cover to strands = 25mm
to obtain 60 mins FR

7No. 12.5 mm strand
per unit

Limestone aggregate

- M/C = 2.8% by weight

18 12:41

Test 1: Units sit directly on steel beams and grout placed between units and around columns

Test 1

Grout placed
between units and
around column

Exposed steel requires protection

Tie beam

Wall offset column line

Wall on column line

Fire Protection:

15mm Lafarge fire board

60mins FR in standard test.

Fire Load:

Aim: to try and follow standard fire curve upto 60 mins.

Used Annex A from BSEN1991-1-2

Office fire load = 511 MJ/m^2

UK NA Office load = 570 MJ/m^2

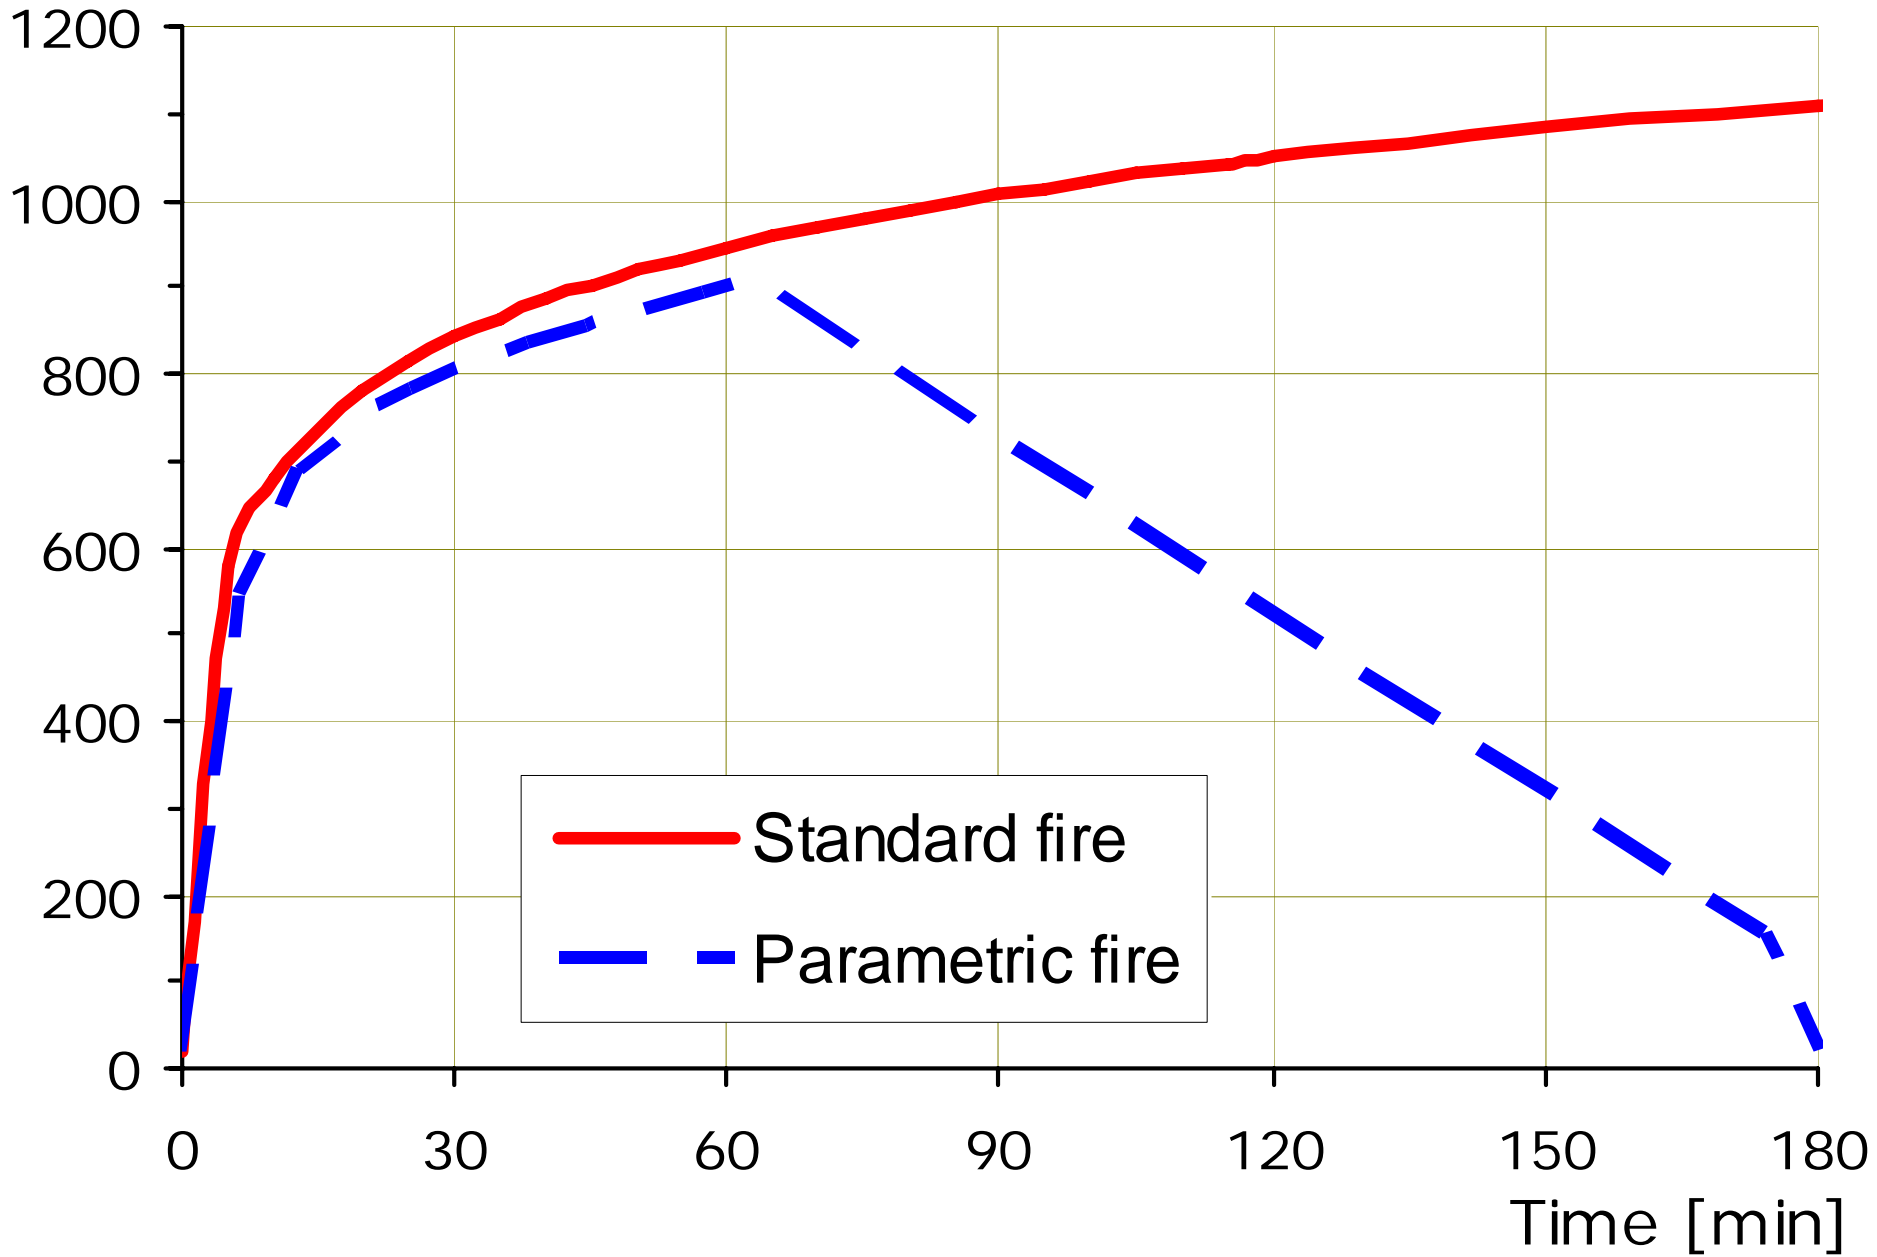

$\therefore 32.5 \text{ kg wood/m}^2$ used.

570MJ/m²

(32.5kg wood/m²)

Temperature [$^{\circ}\text{C}$]

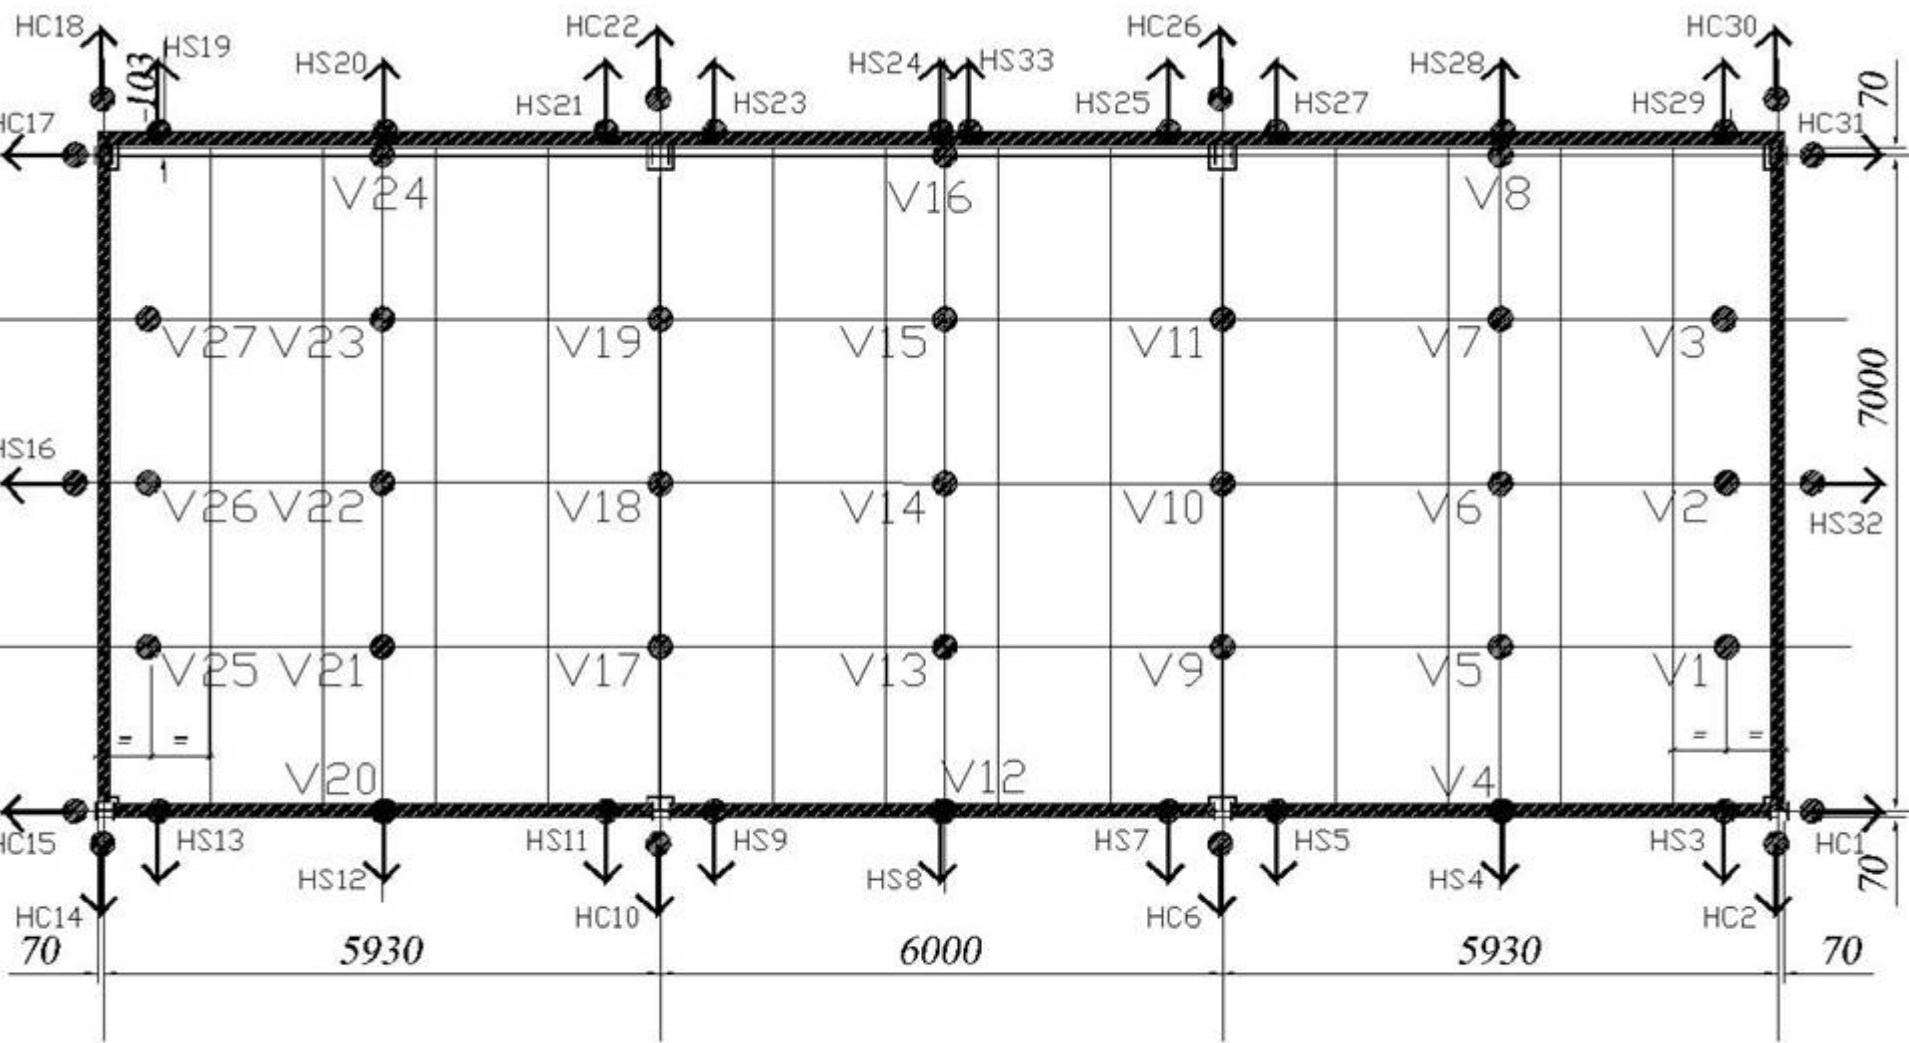

3 openings 2.2m×16m high

Increase in ventilation will increase
temp & decrease duration

Total load = 7.67 kN/m^2 (Applied = 4.71 kN/m^2)

Load Ratios: 0.34 bending; 0.26 shear.

Horizontal movement measured at 33 locations

Vertical displacement measured at 27 locations

Reference frame

DING S

34

Temperature measurements: per test

24 atmosphere temperature measurements

90 beam temperature measurements

140 slab temperature measurements

A total of 628 data points were measured

Test 1: Average atmosphere temperature

Fire Resistance - reminder

Horizontal displacements at 54 mins (1053°C atmosphere temp)

Column moved out 23mm more than the unit

Design to BSEN1992-1-2

Maximum strand temp = 553°C

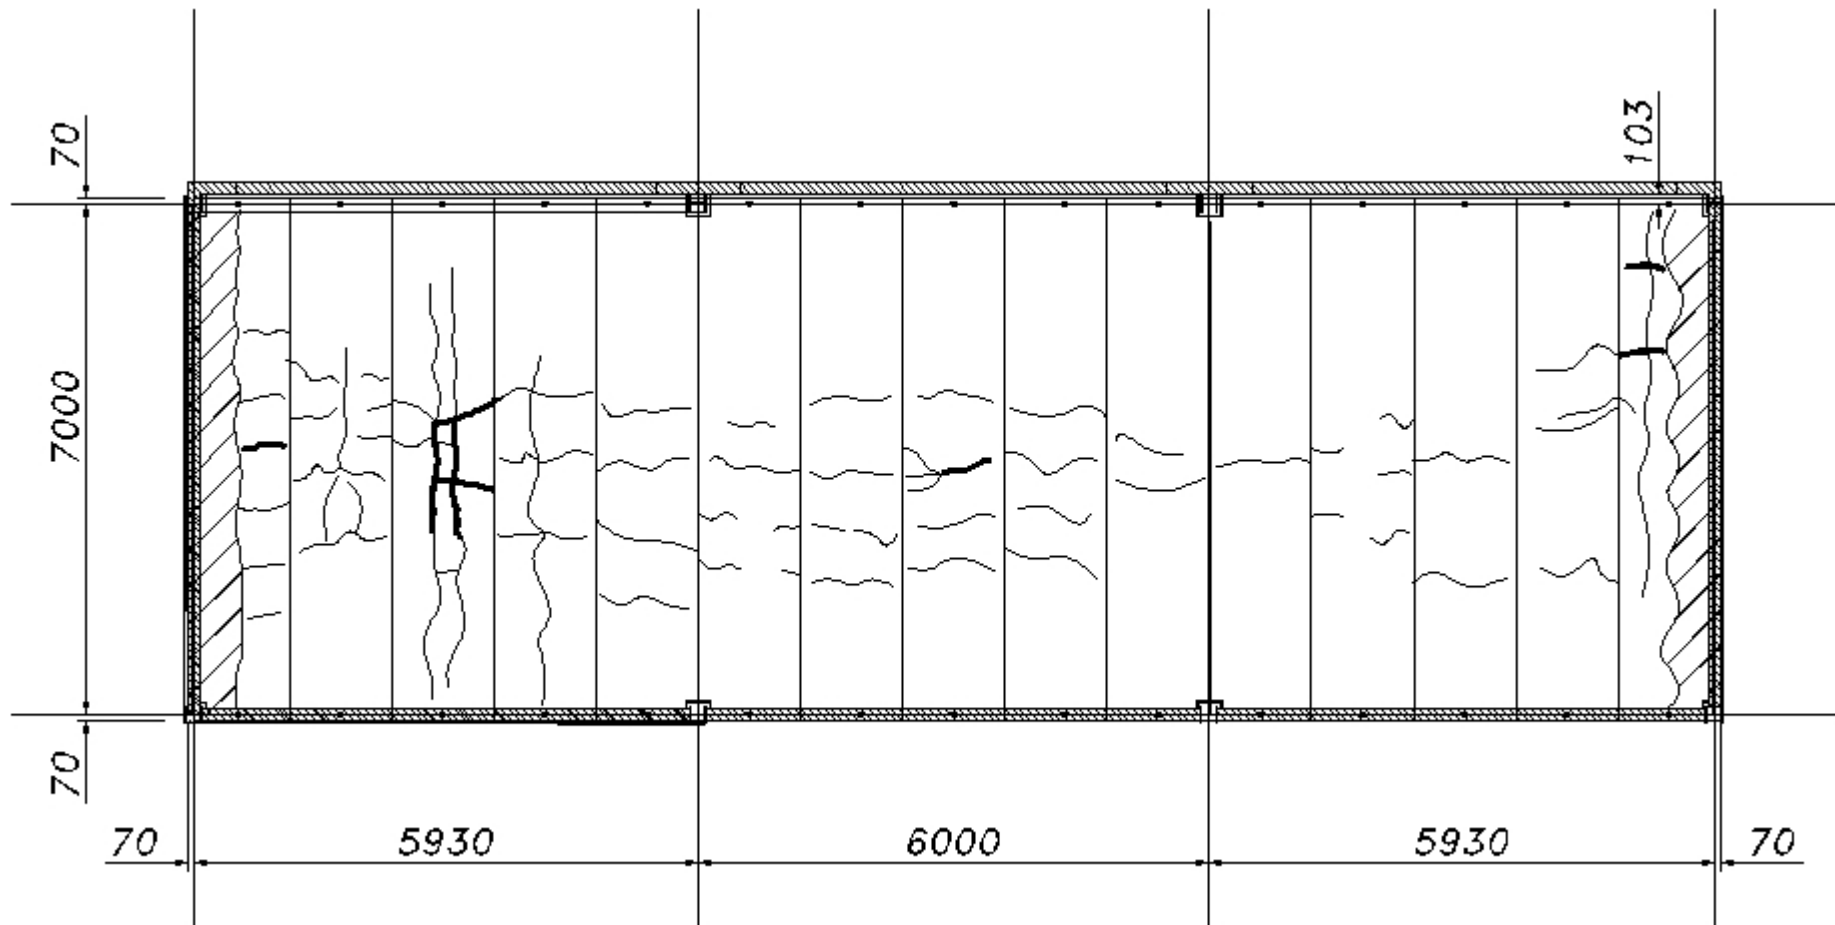

Flexural capacity = 39.7kNm

Applied load = 54.8kNm

Residual slippage increased towards ends

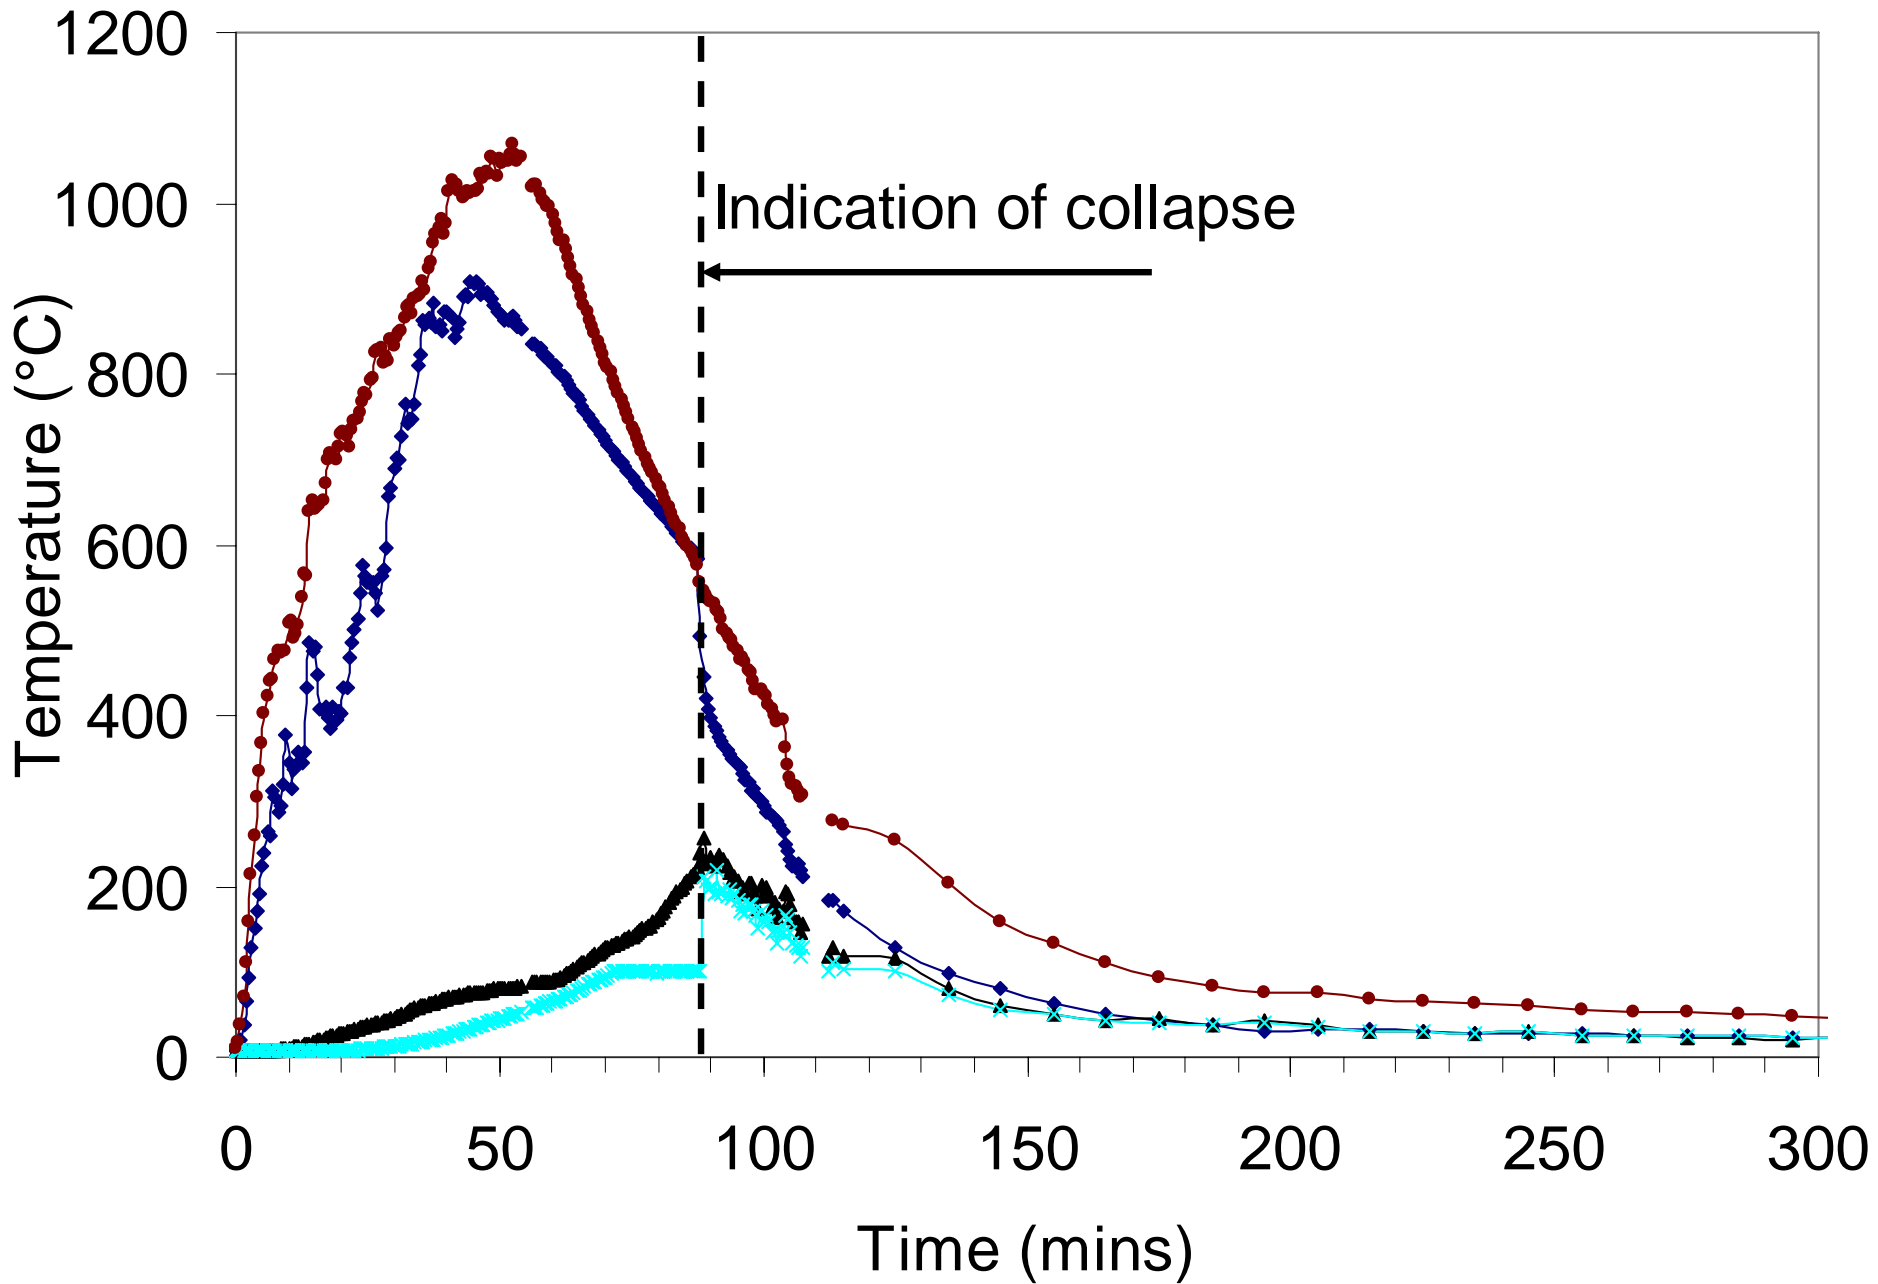

Test 1

**No significant
spalling**

Test 2: Different end conditions

Different end restraints (Test 1 & Test 2)

Test 1

Test 2

No additional 'fixity'

Class 2A

(Generally under 4 stories)

T12 u-bars per unit were placed around 19mm dia stud.

Class 2B

Test 2 : Additional reinforcement

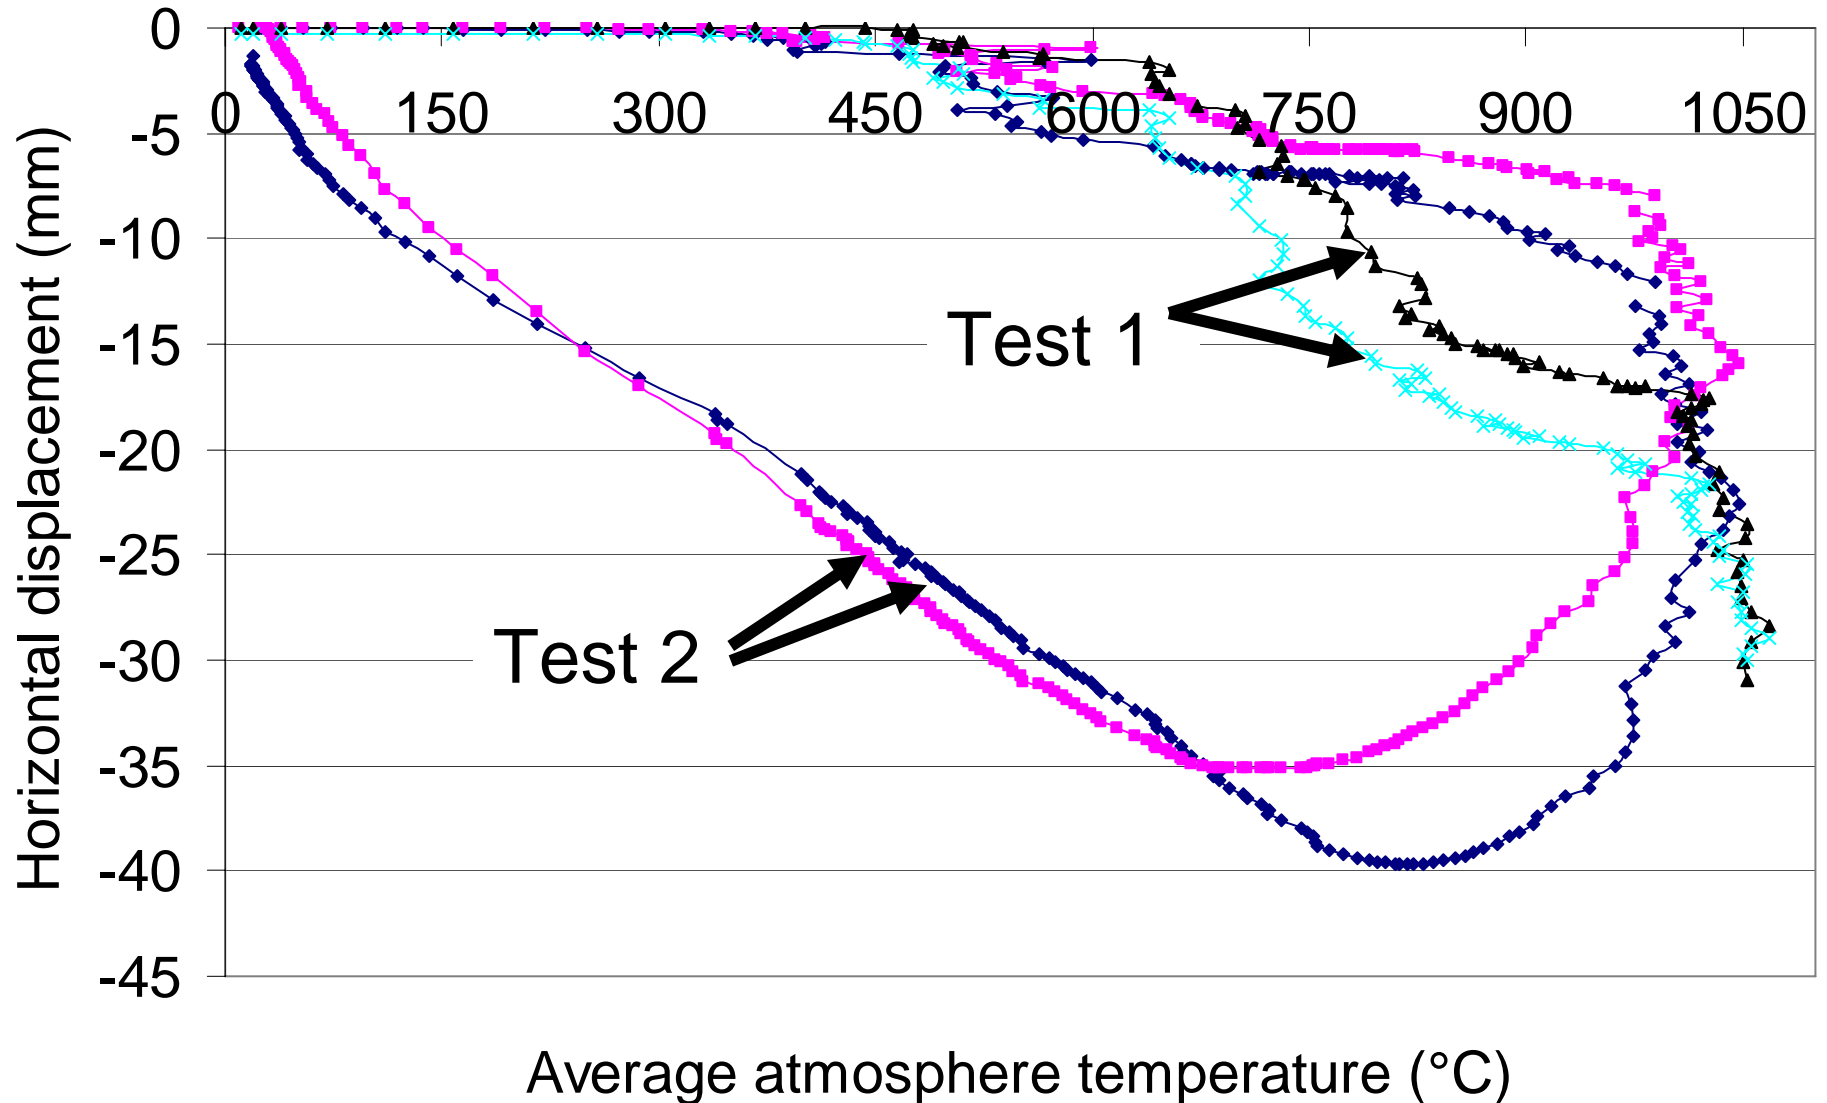

Column pushed out

Column displacement

**Additional bars
kept unit in place**

**(Time of fracture
can be obtained
from data)**

Fracture of end units:

Test 1: 87mins (576°C)
& 103 mins (394 °C)

Test 2: 76mins (870°C)
& 95mins (645°C)

Conclusions (1)

- System performed well during the heating phase, under a very severe (unrealistic ?) fire.
- The system supported the applied load during the cooling phase (even though this was ignored during the design)
- Test 1 and Test 2 had similar performance (except for the end units).
- There was evidence of a lateral compressive strip forming enhancing flexural and shear capacity.

Conclusions (2)

- No significant spalling occurred.
- The parametric curve produced lower temps during the heating phase and should be addressed.
- Although the applied load was higher than the assumed office load the LR's of 0.34 and 0.26 were low. A range of LR's should be considered.

A photograph of a large fire burning through a building structure at night. The fire is intense, with bright orange and yellow flames rising from the structure. The building's framework is visible, showing significant damage. The scene is dark, with the fire providing the primary light source.

Thank you
